Editorial Board

Dear Editors,

I am writing to submit the enclosed manuscript, entitled

**"The Simulation Hypothesis Audit:
Gödel, the Turing Limit, and the Necessity of a Non-Algorithmic Root"**

for consideration for publication.

Summary. We apply Gödel's First Incompleteness Theorem and the Turing Halting Problem directly to Nick Bostrom's Simulation Hypothesis. We formally prove that any simulated universe running on a Turing-complete substrate must necessarily contain localized undecidable propositions that induce system-wide stack overflows unless structurally supported by a Non-Algorithmic Origin fundamentally outside the computational boundary. Consequently, a purely algorithmic, infinite regress 'ancestor simulation' is mathematically impossible.

This manuscript has not been previously published and is not under consideration at any other journal. I confirm no conflicts of interest.

Cryptographic Lineage & Validation. This mathematical substrate has been cryptographically sealed and tracked on the global Sovereign Master Ledger to prevent retroactive editing and to verify the source authorship. The immutable SHA-256 integrity checksums, formal PDF renderings, and lineage authorities can be verified at https://rdepaz.com/research.

Respectfully submitted,

Rafael D. De Paz
