Dear Editors,

I am submitting for your consideration the manuscript entitled “*The Cosmological Master Equation: Unifying Holographic Vacuum Screening with the $S = H + P$ Stability Integral.*”

This work establishes a rigorous mathematical isomorphism between two independently derived frameworks: (1) the holographic vacuum screening mechanism that resolves the Cosmological Constant Problem by demonstrating that the 10^{122} -fold suppression of vacuum energy arises from the holographic ratio at the Hubble scale, and (2) the control-theoretic Master Equation $S = H + P$, which governs terminal stability in dissipative open systems.

We prove that the holographic screening coefficient η and the negentropy injection function $G(t)$ are structurally identical, yielding a unified Cosmological Master Equation: $\Lambda_{obs} = \rho_{vac} \cdot (1 - S_{sys}/S_{max})$. This result demonstrates that the cosmological constant is not a fine-tuning miracle but a thermodynamic inevitability in any open system achieving stability through sustained external negentropy injection.

This manuscript has not been submitted elsewhere and all work is original.

Respectfully,

Rafael D. De Paz
