Dear Editorial Board,

I am writing to formally submit my manuscript entitled "**Chaos, Determinism, & The Distributed Edge Entropy Bound**" for consideration as a research article in *Chaos: An Interdisciplinary Journal of Nonlinear Science*.

This manuscript presents a rigorous mathematical and topological derivation defining an absolute $O(1)$ operational boundary on stochastic divergence within high-probability execution matrices (such as edge-computing neural systems). I demonstrate, using thermodynamic limits and discrete algorithmic constraints, that computational chaos vectors can be algorithmically collapsed into absolute deterministic constants gracefully, averting system-level infinite loop topologies without requiring hardware throttling.

Given the manuscript's strict bridging between nonlinear probability dynamics and constant-path execution models, I believe it falls perfectly within the scope of your esteemed journal and will be of exceptional interest to researchers operating at the intersection of dynamical systems, computer science, and logic.

This work is entirely original, has been mathematically localized, and is not actively under review by any other journal. Additionally, all bounding equations within this paper trace back formally to universally accepted principles embedded in Shannon transmission bounds and Turing algorithmic constraints.

Thank you for your time and consideration. I look forward to your rigorous evaluation.

Sincerely,

Rafael D. De Paz
