Editorial Board

Dear Editors,

I am writing to submit the enclosed manuscript, entitled

**“The Grace Protocol: Dual-Track Input Validation for Graceful
Cyber-Security”**

for consideration for publication.

Summary. In formal Language-Theoretic Security (LangSec), deterministic parsers enforce absolute security but often suffer from false positives on edge-cases. This paper introduces the Grace Protocol, a dual-track validation architecture. Track A (The Justiciary) applies strict, $O(1)$ determinism to reject malformed packets. Track B (The Intercessor) utilizes heuristic, Bayesian models to analyze non-malicious drift. We prove that routing edge cases through heuristic mercy rather than immediate terminal rejection creates a computationally superior Intrusion Detection System.

This manuscript has not been previously published and is not under consideration at any other journal. I confirm no conflicts of interest.

Cryptographic Lineage & Validation. This mathematical substrate has been cryptographically sealed and tracked on the global Sovereign Master Ledger to prevent retroactive editing and to verify the source authorship. The immutable SHA-256 integrity checksums, formal PDF renderings, and lineage authorities can be verified at <https://rdepaz.com/research>.

Respectfully submitted,

Rafael D. De Paz
