Editorial Board

Dear Editors,

I am writing to submit the enclosed manuscript, entitled

“Sliding-Window MTD Caching: Achieving $O(1)$ Verification Speed in Stateful Systems”

for consideration for publication.

Summary. Moving Target Defense (MTD) is recognized as a robust network security paradigm. This paper details the mathematical profiling of an MTD synchronized with a Sliding-Window Schema Cache. By storing validation states precisely aligned with the MTD rotation phase, an ALSF (Adaptive Linguistic Security Framework) gateway can reduce ingestion validation from $O(N)$ linear time ($\approx 1.19\text{ms}$) to $O(1)$ constant time ($\approx 0.00004\text{ms}$) on repeating payloads, achieving a 30,000x acceleration without compromising dynamic cryptographic integrity.

This manuscript has not been previously published and is not under consideration at any other journal. I confirm no conflicts of interest.

Cryptographic Lineage & Validation. This mathematical substrate has been cryptographically sealed and tracked on the global Sovereign Master Ledger to prevent retroactive editing and to verify the source authorship. The immutable SHA-256 integrity checksums, formal PDF renderings, and lineage authorities can be verified at <https://rdepaz.com/research>.

Respectfully submitted,

Rafael D. De Paz
