Dear Editors,

I am writing to submit “Foundations of Computational Theology: Set-Theoretic Meta-Ethics and the Gödelian Completion” for consideration in *Theology and Science*.

Summary. We introduce Computational Theology as a formal framework applying mathematical logic, set theory, and control theory to theological questions. Key results include: moral truth as set membership in a master specification; the Gödelian necessity of an external root authority; and a cybernetic stability loop governing systemic convergence. This paper inaugurates a research program with companion papers on consciousness, free will, and theodicy.

Suggested Reviewers.

1. **Prof. Robert John Russell** (Graduate Theological Union) — Founder of CTNS.
2. **Prof. Nancey Murphy** (Fuller Theological Seminary) — Science-theology interface.
3. **Prof. William Lane Craig** (Houston Christian University) — Formal philosophical theology.

Respectfully submitted,

Rafael D. De Paz
