Dear Editors,

I submit “Epistemological Triage: A Bayesian Framework for the Evaluation of Extraordinary Claims” for consideration in *Philosophy of Science*.

Summary. We formalize Sagan’s dictum into a rigorous Bayesian triage framework. We define claim extraordinariness as negative log-prior, derive that the evidence threshold scales exponentially with surprisal, and construct a four-level triage matrix based on Type I/II error cost asymmetry. Applications span medical diagnosis, intelligence analysis, the scientific replication crisis, and anomalous aerial phenomena.

Suggested Reviewers.

1. **Prof. Stephan Hartmann** (LMU Munich) — Bayesian epistemology and philosophy of science.
2. **Prof. James Hawthorne** (University of Oklahoma) — Confirmation theory and inductive logic.
3. **Prof. Kevin McCain** (University of Alabama) — Evidentialism and epistemic warrant.

Respectfully submitted,

Rafael D. De Paz
