Dear Editors,

I submit “The Multitime Transport Theorem: State Continuity in Non-Contiguous Temporal Frames” for consideration in *Minds and Machines*.

Summary. We formalize how conscious agents and AI systems maintain identity across temporal discontinuities (sleep, anesthesia, context window boundaries). We prove that identity-preserving transport requires a verifiable state receipt, and that without one, the identity vector dissolves to noise. Applications span personal identity philosophy, AI alignment, and consciousness neuroscience.

Suggested Reviewers.

1. **Prof. Susan Schneider** (University of Connecticut) — AI consciousness and personal identity.
2. **Prof. David Chalmers** (New York University) — Philosophy of mind and consciousness.
3. **Prof. Murray Shanahan** (Imperial College London) — AI cognition and embodiment.

Respectfully submitted,

Rafael D. De Paz
